# ASMLog v3.0

**English User Manual**

International Edition | Amateur radio logging and CW training

Made by Tommy Clemmensen - OZ1THC

1 November 2026 | Release documentation

## 1. About ASMLog

ASMLog is a Windows x64 application for amateur-radio QSO logging and Morse-code (CW) practice. It supports six log types, four operating modes, and eight interface languages. Version 3.0 extends international contest point handling while retaining the v2.0 training workflow.

## 2. Start the application

Extract the distribution ZIP to a folder, retaining the original subfolders and data files. Launch ASMLog.exe from the extracted program folder. A splash screen appears at startup; follow the on-screen instruction to continue. Use the numbered menu choices. In submenus, 0 normally means Back.

## 3. Main menu

• **1. New QSO** - Enter a contact or start a training QSO.

• **2. Show QSO Log** - Review logged contacts.

• **3. Search Callsign** - Find an existing callsign.

• **4. Start New Log** - Clear the selected log; back up important data first.

• **5. Print Log** - Export HF ADIF or contest Cabrillo.

• **6. Settings** - Set station details, log type, mode, speed, and language.

• **7. Highscore** - View stored CW training results.

• **8. Delete Highscore** - Delete saved results using the provided menu.

## 4. Supported logs and contests

Select the desired log type in Settings.

• 1. CQ WPX CW Contest

• 2. HF Log

• 3. ARRL DX CW Contest

• 4. Russian DX CW Contest

• 5. CQ WW DX CW Contest

• 6. Scandinavian Activity Contest (SAC CW)

Each contest uses its own exchange, scoring and multiplier rules. Check the selected contest before entering contacts.

## 5. Operating modes

• **RADIO** - Log real-radio QSOs with the keyboard; no generated CW.

• **CW** - Simulated Morse audio without displayed answer text.

• **CW + TEXT** - Simulated Morse audio and corresponding text on screen.

• **TEXT** - Simulated exchanges displayed as text without Morse audio.

Suggested learning progression: TEXT -> CW + TEXT -> CW -> RADIO. Only pure CW mode saves training highscores.

## 6. Settings and language selection

Open Settings to configure the log type, operating mode, callsign, name, e-mail, address, postal code, city, power, ARRL DX power/state or province where relevant, and CW speed (WPM). Settings persist between program runs. The default release settings contain blank operator identity fields; enter your own information before use.

Available interface languages: **English, German, Russian, Spanish, Italian, French, Polish and Danish.** Select your preferred language using the language selection menu. Some contest-specific output may remain in English.

## 7. Logging a QSO

Select the log type and mode, then choose New QSO. Enter the requested fields (for example callsign, band, RST and contest exchange). The exact sequence depends on the selected log type. Use Show QSO Log to review the recorded result. Contest duplicates may score zero points.

## 8. CW training

In CW mode, choose a session length of **5, 10, 15, 30 or 60 minutes**. ASMLog generates simulated QSOs during the selected period. Enter the received details, then review the checker results after the session. CW + TEXT and TEXT are intended as assisted practice modes and do not write CW highscores.

Contest checkers distinguish the **Claimed** score from the checked **Real** score. HF CW training instead reports field accuracy (including callsign, RST, name and QTH).

## 9. Scores, multipliers and highscore

Contest point and multiplier rules differ by contest and operator location. Version 3.0 includes international scoring support for the contest modules. Duplicates may receive zero points. Check results before submitting a contest log. Highscores are recorded for CW training only; the training duration is part of the result.

## 10. New log and export

Start New Log clears the current log: export or back it up first. Print Log provides ADIF export for HF Log and Cabrillo export for supported contests. Inspect the exported callsign, contest information, exchange, QSO lines and claimed score before external submission.

## 11. Files and backups

Keep the distribution directory structure intact. The application uses folders such as **data/** for settings/reference data, **log/** for logged contacts and exports, **facit/** for simulated reference records, and **highscore/** for saved results. Back up the program folder before clearing logs or making major changes.

## 12. Troubleshooting

• No Morse audio: check the selected mode, WPM and Windows audio output.

• Unexpected contest fields or points: verify the selected log type and operator settings.

• No highscore: verify you are using pure CW training mode.

• Missing files or startup errors: restore the original folder structure and required data files.

• Unexpected export content: verify the QSO log and settings before exporting again.

## 13. Quick start

Enter your callsign -> choose your language and log type -> select a mode -> check power and WPM -> start a QSO or training session -> review the log/results -> export or back up as needed.

## 14. Scope

Morserino-32 input and the planned CW pileup trainer are not part of ASMLog v3.0. This manual documents user-facing behavior; contest rules and operating requirements should be verified independently for real contest submissions.
